The phenomena of Japan emerging as one of the most competitive industrial nations in the twentieth century and the general shift of competitiveness to East Asia since the 1980s have been widely studied by many scholars from different fields of the social sciences. Drawing on sources from Japanese, Swiss, and American archives, the historical analysis of this book tackles a wide range of actors and sheds light on the various processes that enabled Japanese watch companies to transfer technology and expand commercially starting in the second half of the nineteenth century. By exploring the case of the watch industry, this book serves to establish a better understanding of the origins of the competitiveness of Japanese manufacturing and its evolution until its decline in the post bubble economy (in the 1990s and 2000s).

An anecdotal guide for the perplexed new investigator as well as a refreshing resource for the old pro, covering everything from valuable personality traits for an investigator to social factors conducive to scientific work. Santiago Ramón y Cajal was a mythic figure in science. Hailed as the father of modern anatomy and neurobiology, he was largely responsible for the modern conception of the brain. His groundbreaking works were New Ideas on the Structure of the Nervous System and Histology of the Nervous System in Man and Vertebrates. In addition to leaving a legacy of unparalleled scientific research, Cajal sought to educate the novice scientist about how science was done and how he thought it should be done. This recently rediscovered classic, first published in 1897, is an anecdotal guide for the perplexed new investigator as well as a refreshing resource for the old pro. Cajal was a pragmatist, aware of the pitfalls of being too idealistic—and he had a sense of humor, particularly evident in his diagnoses of various stereotypes of eccentric scientists. The book covers everything from valuable personality traits for an investigator to social factors conducive to scientific work.
