The monitoring of quality has been part of the educational landscape for many decades. Originally the need to monitor arose as part of an economic process whereby policy makers wanted to discern the return on investment in education. This bottomline thinking, while still prominent, has receded into the background in light of global changes

and the emergence of a global economy. Now in addition to the question "what is the return on investment?", the more important question is "are the students in schools ready to participate in the economy of a 21st century society?". This is underpinned by the inquiry into what knowledge and competencies are required for students to participate meaningfully in nation-building. This inquiry can only be undertaken by means of monitoring, evaluating where the students are and what is required so that students reach their potential. In an ever-changing technologically-oriented world the manner in which competencies and knowledge are identified and how these need to be measured and identified is important. In this book, the theory and practice of underpinning the monitoring of the quality of education is described. This is followed by a number of practical examples, in the form of country case studies, on how theory plays out in practice. The book further provides common themes across developed and developing emerging economies underscoring the need for approaches which are locally relevant but internationally transferable.

The KS3 curriculum plays a critical part in giving students the best possible start to their secondary education and preventing the need for intervention later on. Featuring examples of curriculum models and audits of current practice, chapters cover key topics such as: developing the planning cycle; transitioning between primary and secondary English; assessment in KS3 English; creating a model that supports and challenges students of all levels; LAC and SPAG: divisive or cohesive abbreviations; speaking and listening in the KS3 English curriculum; using multimodal texts; examples of how meaningful homework can successfully embed itself in a KS3 English curriculum model. Make Key Stage 3 Matter in English will be an invaluable resource for KS3 English coordinators, teachers and all those involved in the planning and delivery of the KS3 English curriculum.

This book looks at the purpose and pedagogy of STEM teaching and explores the ways in which STEM subjects can interact in the curriculum to enhance student understanding, achievement and motivation. By reaching outside their own classroom, teachers can collaborate across STEM subjects to enrich learning and help students relate school science, technology and maths to the wider world. Packed with ideas and practical details for teachers of STEM subjects, the new revised edition of this book: ■ considers what the STEM subjects contribute separately to the curriculum and how they relate to each other in the wider education of secondary school students; ■ describes and evaluates different curriculum models for STEM; ■ suggests ways in which a critical approach to the pedagogy of the classroom, laboratory and workshop can support and encourage all pupils to engage fully in STEM; ■ addresses the practicalities of introducing, organising and sustaining STEM-related activities in the secondary school; ■ looks to ways schools can manage and sustain STEM approaches in the long-term. This new revised edition is essential reading for trainee and practising teachers, those engaged in further professional development and all who wish to make the learning of science, technology, engineering and mathematics an interesting, motivating and exciting experience for their students.

Debates in ICT and Computing Education explores the major issues teachers encounter in their daily professional lives. It encourages critical reflection and aims to stimulate both novice and experienced teachers to think more deeply about their practice, and link research and evidence to what they have observed in schools. Chapters tackle established and contemporary issues enabling teachers to reach informed judgements and argue their point of view with deeper theoretical knowledge and understanding. Debates include teacherless classrooms; personalised learning; creativity; digital literacy; visual literacy; e-tools; learning platforms; and opportunities for lifelong learning.

A companion to Aspects of Teaching Secondary Science, the first section of this reader provides an overview of the key issues, discussing the nature of science and its role in the school curriculum. The second section goes on to examine critically the ways in which science is reflected in the school curriculum, while the third section discusses recent curriculum initiatives and developments. Turning the focus from what is taught on to who is taught, section four shows that students are very much active learners in the classroom, making sense of their experiences and constructing their own meanings. The final section covers the role of research in science education, giving examples of research papers and considering how productive collaboration between teachers and researchers can impact upon the effectiveness of classroom practice.
